

Installing Ushahidi 3.x on Mac OS

Props to Woody for hand-holding and instructions on this.

There are 3 main ways to install Ushahidi 3.x on Mac OS:

- Using Vagrant virtual machine
- Using [Homebrew to install mysql and run Ushahidi natively](#)
- Use [Mamp](#)

Vagrant is generally recommended for Ushahidi 3.x because it allows you to isolate your environment, and you don't have to manage a *AMP (Apache-MySQL-Php) stack on your Mac. Homebrew is recommended over Vagrant if you're going to develop other websites locally on your Mac. Mamp is last on the list of recommendations.
