

Installing Ushahidi 3.x on OSX with MAMP Pro

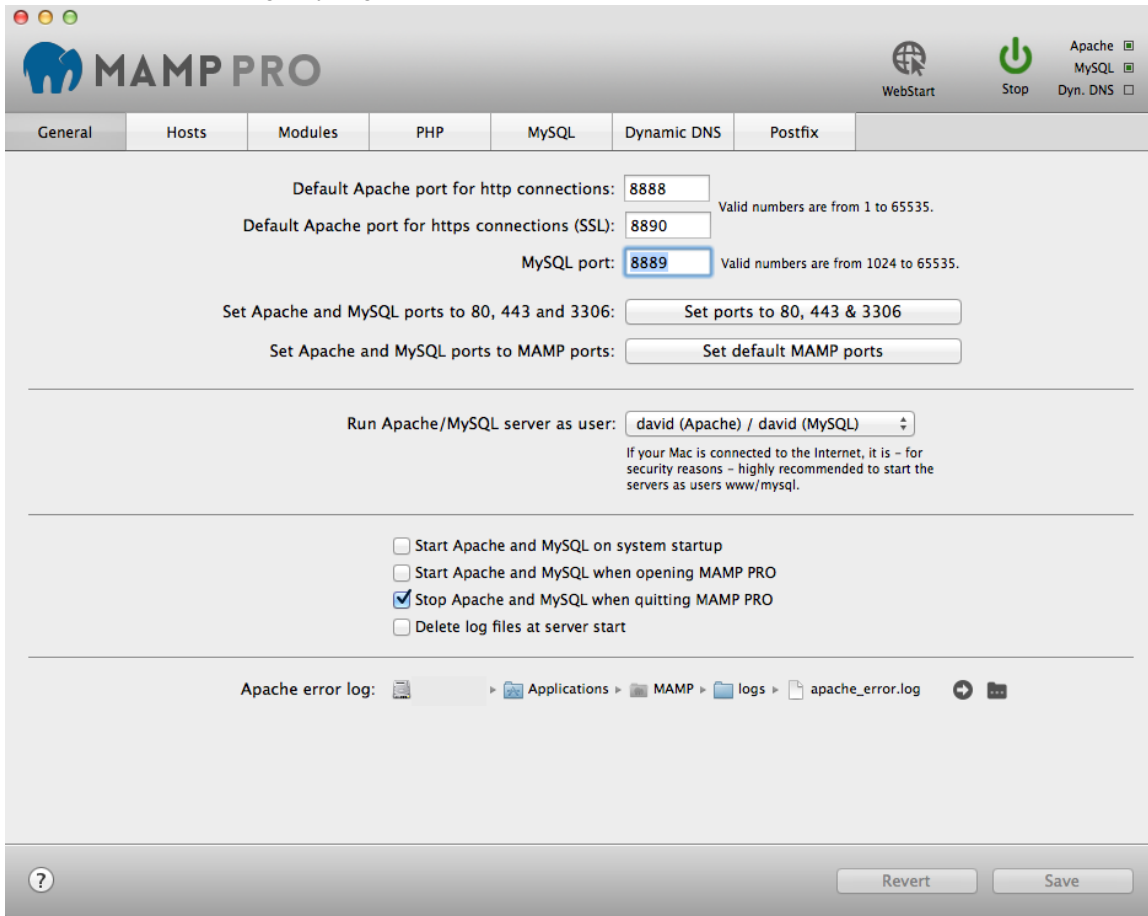

Install Git

If git is not installed on your machine or the version you have installed by default requires XCode, download and install this version:

- <http://git-scm.com/download/mac>

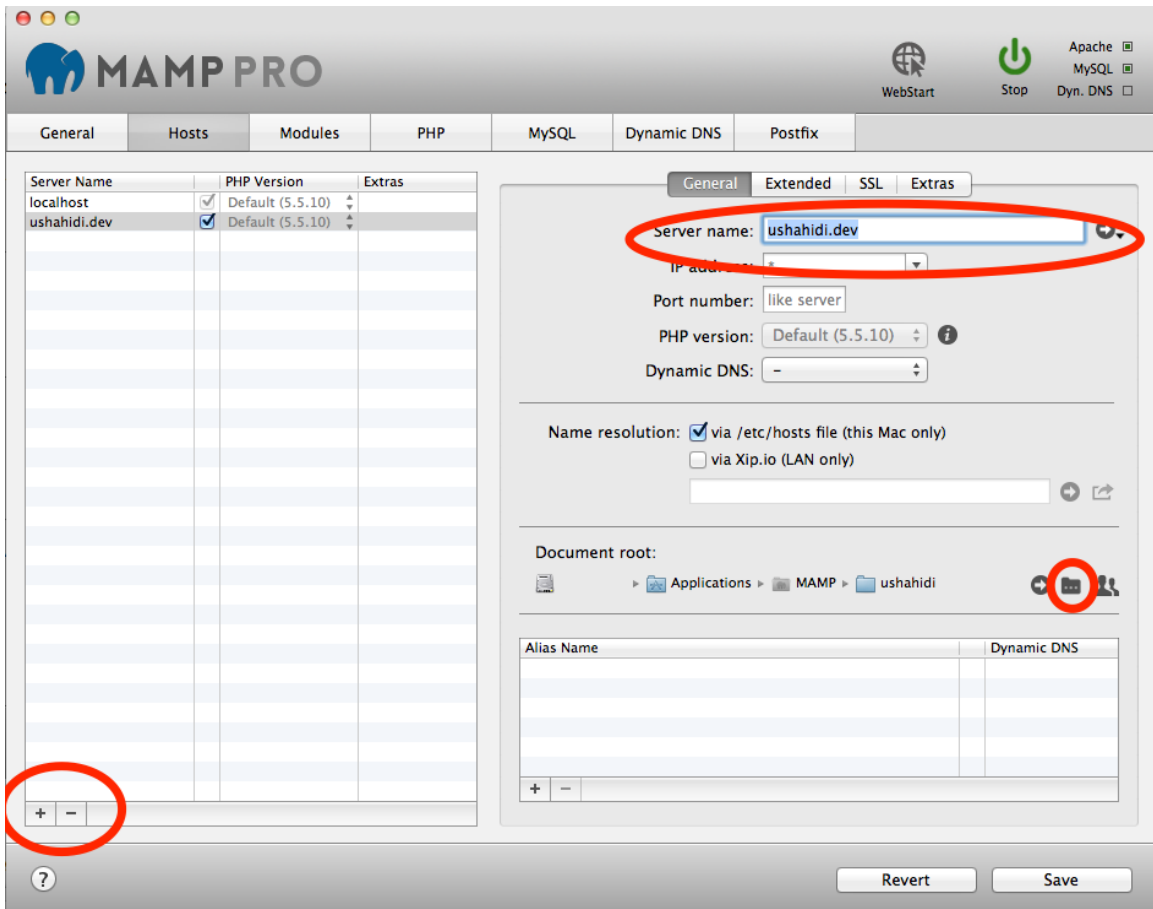

Setting up MAMP Pro

- GENERAL - no need to change anything here:

- HOSTS

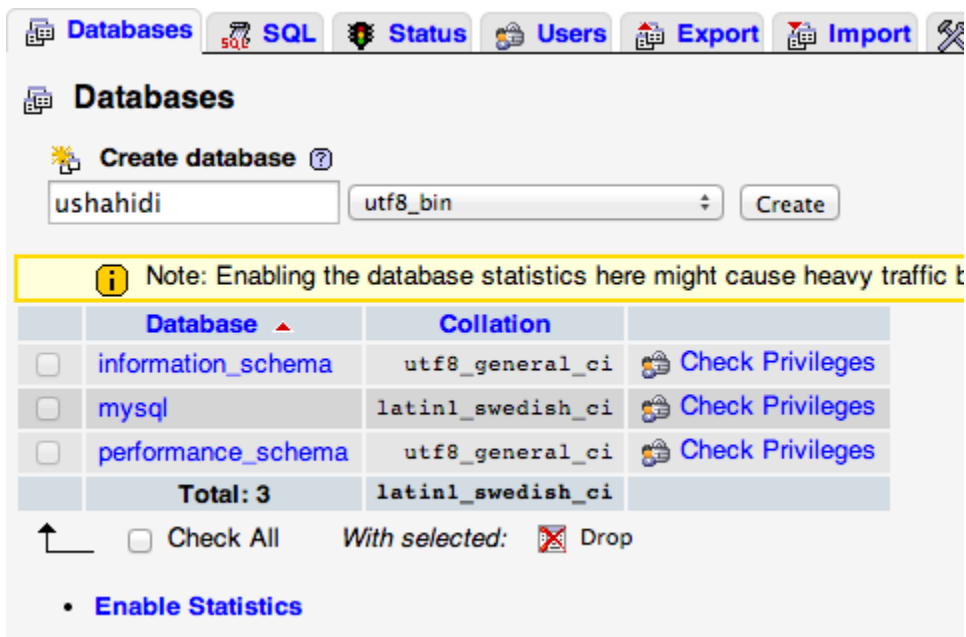

- Create a new host by clicking the [+] at bottom left
- Give your server a name - in our case (ushahidi.dev)
- Create a folder to hold the site by clicking the folder icon - in our case /Applications/MAMP/ushahidi

- At this point we don't need to modify anything else

Create a Database

- Click on the phpMyAdmin link at the bottom of the MySQL screen above
- Click on the Databases tab within phpMyAdmin
- Create an ushahidi database

Downloading and installing Ushahidi

- Open the 'Terminal' app by going to Applications > Utilities > Terminal
- Change to our document root folder

```
cd /Applications/MAMP/ushahidi
```

- Remove the default MAMP Pro files from this directory

```
rm MAMP-PRO-Logo.png  
rm index.php
```

- Clone the Ushahidi Platform repository from Github

```
git clone --recursive https://github.com/ushahidi/platform ./
```

- Follow the rest of the instructions listed here with the exception of using the database.php file listed below:

```
<?php defined('SYSPATH') or die('No direct access allowed.');
```

```
/**  
 * Database Config  
 */  
 * @author   Ushahidi Team <team@ushahidi.com>  
 * @package  Ushahidi\Application\Config

 */  
return array  
(  
  'default' => array  
(  
    'type' => 'MySQLi',  
    'connection' => array(  
      'hostname' => 'localhost',  
      'database' => 'ushahidi',  
      'username' => 'root',  
      'password' => 'root',  
      'socket' => '/Applications/MAMP/tmp/mysql/mysql.sock',  
      'persistent' => FALSE,  
    ),  
    'table_prefix' => '',  
    'charset' => 'utf8',  
    'caching' => TRUE,  
    'profiling' => TRUE,  
  )  
);
```

- Your new site will be accessible at <http://ushahidi.dev:8888/>
